

Exercise 1. Show that if \mathbf{A} is triangular and unitary, then it is diagonal.

Solution 1.

Exercise 2. Consider Hermitian (self-adjoint) matrices $\mathbf{A}, \mathbf{B} \in \mathbb{C}^{n \times n}$.

- Prove that all eigenvalues of \mathbf{A} are real.
- Prove that if \mathbf{x}_k is the k th eigenvector, then eigenvectors with distinct eigenvalues are orthogonal.
- Prove that the sum of two Hermitian matrices is Hermitian.
- Prove that the inverse of an invertible Hermitian matrix is Hermitian.
- Prove that the product of two Hermitian matrices is Hermitian if and only if $\mathbf{AB} = \mathbf{BA}$.

Solution 2. *2a.* Suppose that \mathbf{A} has an eigenvalue λ with corresponding eigenvector \mathbf{v} .

$$\mathbf{v}^*(\mathbf{A}\mathbf{v}) = \mathbf{v}^*(\lambda\mathbf{v}) \quad (1)$$

$$= \lambda \mathbf{v}^* \mathbf{v} = \lambda \|\mathbf{v}\|_2. \quad (2)$$

We take the the complex conjugate of both sides to see

$$\bar{\lambda} \|\mathbf{v}\|_2 = (\mathbf{v}^*(\mathbf{A}\mathbf{v}))^* = (\mathbf{A}\mathbf{v})^* \mathbf{v}^{**} \quad ((\mathbf{AB})^* = \mathbf{B}^* \mathbf{A}^*) \quad (3)$$

$$= (\mathbf{v}^* \mathbf{A}^*) \mathbf{v}^{**} \quad (\mathbf{v}^{**} = \mathbf{v}.) \quad (4)$$

$$= (\mathbf{v}^* \mathbf{A}^*) \mathbf{v} \quad (5)$$

$$= \mathbf{v}^* \mathbf{A}^* \mathbf{v} \quad (6)$$

$$= \mathbf{v}^* \mathbf{A} \mathbf{v} \quad (\mathbf{A}^* = \mathbf{A}.) \quad (7)$$

$$= \lambda \|\mathbf{v}\|_2. \quad (8)$$

This leaves us with the equality $\bar{\lambda} \|\mathbf{v}\|_2 = \lambda \|\mathbf{v}\|_2$. This can only hold if either $\lambda = \bar{\lambda}$ i.e. λ is real or $\|\mathbf{v}\|_2 = 0$. As \mathbf{v} is an eigenvector, it cannot be zero, $\|\mathbf{v}\|_2 > 0$. Therefore, the eigenvalues of \mathbf{A} must be real. \square

2b. Suppose that we have two eigenvectors \mathbf{v}_i and \mathbf{v}_j corresponding to distinct eigenvalues λ_i and λ_j . Starting from the relation $\mathbf{A}\mathbf{v}_i = \lambda_i \mathbf{v}_i$, we compute

$$(\lambda_i \mathbf{v}_i)^* \mathbf{v}_j = (\mathbf{A}\mathbf{v}_i)^* \mathbf{v}_j \quad ((\mathbf{AB})^* = \mathbf{B}^* \mathbf{A}^*) \quad (9)$$

$$= \mathbf{v}_i^* \mathbf{A}^* \mathbf{v}_j \quad (\mathbf{A}^* = \mathbf{A}.) \quad (10)$$

$$= \mathbf{v}_i^* \mathbf{A} \mathbf{v}_j \quad (\text{Eigenvalue defn.}) \quad (11)$$

$$= \mathbf{v}_i^* (\lambda_j \mathbf{v}_j). \quad (12)$$

Using the fact that the eigenvalues λ_i and λ_j are real, we can see that

$$(\lambda_i - \lambda_j)(\mathbf{v}_i^* \mathbf{v}_j) = 0. \quad (13)$$

Since the eigenvalues are distinct ($\lambda_i - \lambda_j \neq 0$), we have that

$$\mathbf{v}_i^* \mathbf{v}_j = 0. \quad (14)$$

Therefore, the eigenvectors \mathbf{v}_i and \mathbf{v}_j are orthogonal. □

2c. Let \mathbf{A} and \mathbf{B} be Hermitian matrices.

$$(\mathbf{A} + \mathbf{B})^* = \mathbf{A}^* + \mathbf{B}^* \quad (15)$$

$$= \mathbf{A} + \mathbf{B}. \quad (16)$$

The first line follow because the sum of the adjoint is equivalent to the adjoint of the sum.

The last line follows because both \mathbf{A} and \mathbf{B} are Hermitian.

Alternatively, we can show the same by an entry-wise argument on \mathbf{A} and \mathbf{B} . Let $(\mathbf{A})_{ij} = a_{ij}$ and $(\mathbf{B})_{ij} = b_{ij}$ denote the entries of \mathbf{A} and \mathbf{B} respectively. We can then see that

$$(\mathbf{A} + \mathbf{B})_{ij} = c_{ij} = a_{ij} + b_{ij}. \quad (17)$$

Because both \mathbf{A} and \mathbf{B} are Hermitian, we have that

$$(\mathbf{A}^*)_{ij} = \bar{a}_{ji} = a_{ij} \text{ and } (\mathbf{B}^*)_{ij} = \bar{b}_{ji} = b_{ij}. \quad (18)$$

Taking the adjoint of \mathbf{A} and \mathbf{B} , we see that

$$((\mathbf{A} + \mathbf{B})^*)_{ij} = \bar{c}_{ji} = \bar{a}_{ji} + \bar{b}_{ji} \quad (19)$$

$$= a_{ij} + b_{ij} \quad (20)$$

$$= c_{ij} \quad (21)$$

$$= (\mathbf{A} + \mathbf{B})_{ij}. \quad (22)$$

Since all entries are the same, we have that $(\mathbf{A} + \mathbf{B})^* = \mathbf{A} + \mathbf{B}$. Therefore, the sum of two Hermitian matrices is Hermitian. □

2d. Suppose that \mathbf{A} is an invertible Hermitian matrix with inverse \mathbf{B} . We write this as

$$\mathbf{AB} = \mathbf{I}. \quad (23)$$

Taking the conjugate transpose of both sides, we have that

$$\mathbf{B}^* \mathbf{A}^* = \mathbf{B}^* \mathbf{A} = \mathbf{I}. \quad (24)$$

Right multiplying by \mathbf{B} and using that \mathbf{B} is the inverse of \mathbf{A} ,

$$\mathbf{B}^* \mathbf{AB} = \mathbf{B}^* \mathbf{I} = \mathbf{IB}. \quad (25)$$

As \mathbf{I} is the identity matrix, we get the desired result $\mathbf{B}^* = \mathbf{B}$. □

2e. Let \mathbf{A} and \mathbf{B} be Hermitian matrices.

(\leftarrow) First suppose that $\mathbf{AB} = \mathbf{BA}$. Then taking the adjoint of both sides, we see that

$$(\mathbf{AB})^* = (\mathbf{BA})^* = \mathbf{A}^* \mathbf{B}^*. \quad (26)$$

Using that \mathbf{A} and \mathbf{B} are Hermitian, we simplify the right hand side, so that $(\mathbf{AB})^* = \mathbf{AB}$.

(\rightarrow) Now, suppose that the product \mathbf{AB} is Hermitian. Then we have that $(\mathbf{AB})^* = \mathbf{AB}$.

We expand the lefthand side as

$$(\mathbf{AB})^* = \mathbf{B}^* \mathbf{A}^* = \mathbf{BA}. \quad (27)$$

The rightmost equality holds because both \mathbf{A} and \mathbf{B} are Hermitian. Combining the previous two equations gives us the desired results $\mathbf{AB} = \mathbf{BA}$. \square

Exercise 3. Consider a Unitary matrix $\mathbf{U} \in \mathbb{C}^{n \times m}$.

- Prove that the matrix is diagonalizable
- Prove that the inverse is $\mathbf{U}^{-1} = \mathbf{U}^*$.
- Prove it is isometric with respect to the L^2 norm.
- Prove that all eigenvalues have modulus 1.

Solution 3. 3a. \square

3b. A matrix is unitary if it satisfies $\mathbf{U}^* \mathbf{U} = \mathbf{I}$. If we right multiply by the inverse of \mathbf{U} (assuming it exists), we see that

$$\mathbf{U}^{-1} = \mathbf{U}^* \mathbf{U} \mathbf{U}^{-1} \quad (28)$$

$$= \mathbf{U}^*. \quad (29)$$

\square

3c. Using the fact that $\|\mathbf{y}\|_2^2 = \mathbf{y}^* \mathbf{y}$ for any vector $\mathbf{y} \in \mathbb{C}^m$. We have

$$\|\mathbf{Ux}\|_2^2 = (\mathbf{Ux})^* (\mathbf{Ux}) \quad (30)$$

$$= \mathbf{x}^* \mathbf{U}^* \mathbf{U} \mathbf{x} \quad (31)$$

$$= \mathbf{x}^* \mathbf{x} = \|\mathbf{x}\|_2^2, \quad (32)$$

where we have used that $(\mathbf{AB})^* = \mathbf{B}^* \mathbf{A}^*$ and $\mathbf{U}^* \mathbf{U} = \mathbf{I}$ for unitary matrices \mathbf{U} . Taking the square root of both sides then shows that $\|\mathbf{Ux}\|_2 = \|\mathbf{x}\|_2$. \square

3d. Suppose that we have a unitary matrix \mathbf{U} . Let λ be an eigenvalue of \mathbf{U} and \mathbf{v} be the corresponding eigenvector. Starting from the definition of the eigenvalue, we have $\mathbf{U}\mathbf{v} = \lambda\mathbf{v}$. Taking the norm of both sides, we compute

$$\|\mathbf{U}\mathbf{v}\|_2 = \|\lambda\mathbf{v}\|_2 = |\lambda| \|\mathbf{v}\|_2. \quad (33)$$

In part c., we showed that

$$\|\mathbf{U}\mathbf{v}\|_2 = \|\mathbf{v}\|_2. \quad (34)$$

Since \mathbf{v} is an eigenvector, it cannot be the 0 vector. Therefore, we know that $\|\mathbf{v}\|_2 \neq 0$. Dividing equation 33 by $\|\mathbf{v}\|_2$, we see

$$\frac{\|\mathbf{U}\mathbf{v}\|_2}{\|\mathbf{v}\|_2} = 1 = |\lambda|. \quad (35)$$

□
